

HW 3 - Data Preparation

February 11, 2025

1 Homework 3: Data Preparation

CPE232 Data Models

1.1 Project setup

```
[25]: # %%bash
      # pip install matplotlib
```

```
[26]: import pandas as pd

      df = pd.read_csv('bike_sharing_demand.csv')
```

```
[27]: df.head()
```

```
[27]:
```

	season	year	month	hour	holiday	weekday	workingday	weather	temp	\
0	spring	0	1	0	False	6	False	clear	9.84	
1	spring	0	1	1	False	6	False	clear	9.02	
2	spring	0	1	2	False	6	False	clear	9.02	
3	spring	0	1	3	False	6	False	clear	9.84	
4	spring	0	1	4	False	6	False	clear	9.84	

	feel_temp	humidity	windspeed	count
0	14.395	0.81	0.0	16
1	13.635	NaN	0.0	40
2	13.635	0.80	0.0	32
3	14.395	0.75	0.0	13
4	14.395	0.75	0.0	1

```
[28]: url = "https://kmutt.me/"
```

1.2 The Secret URL Challenge!

Welcome, brave explorer! Your mission, should you choose to accept it, is to uncover a hidden phrase scattered across the questions below. Each question holds a vital clue—a word or phrase—that will bring you closer to unlocking the **Secret URL**!

Once you have gathered all the hidden words, combine them **in order** and attach them to this URL:

`https://kmutt.me/[your_combined_phrase]`

For example, if you discover the words ['quest', 'begin'], your final URL will be:

`https://kmutt.me/questbegin`

Are you ready to solve the mystery and reveal the secret link? Let the adventure begin!

```
[29]: df.describe()
```

```
[29]:
```

	year	month	hour	weekday	temp	feel_temp	\
count	200.0	200.0	200.000000	200.000000	200.000000	200.000000	
mean	0.0	1.0	11.455000	3.160000	9.389000	11.689600	
std	0.0	0.0	6.832377	2.235933	3.713618	4.580663	
min	0.0	1.0	0.000000	0.000000	3.280000	3.030000	
25%	0.0	1.0	6.000000	1.000000	6.560000	9.090000	
50%	0.0	1.0	11.000000	3.000000	8.200000	10.985000	
75%	0.0	1.0	17.000000	5.000000	10.660000	13.635000	
max	0.0	1.0	23.000000	6.000000	18.860000	22.725000	

	humidity	windspeed	count
count	170.000000	200.000000	200.000000
mean	0.559059	13.745452	53.950000
std	0.176368	8.637962	48.931472
min	0.280000	0.000000	1.000000
25%	0.422500	7.001500	12.000000
50%	0.510000	12.998000	47.000000
75%	0.690000	19.250775	76.000000
max	1.000000	36.997400	219.000000

1.2.1 Clue 1: A Note from the Keeper of the Winds

“Traveler, the first clue hides in the mist! To uncover it, follow these steps carefully:”

1. Find the moment when the wind was strongest during misty weather.
2. Look at that row and gather the numbers hidden in the hour and count columns.
3. Add 65 to each number and turn them into letters. but divide count by 3.
4. Arrange them in the order given by hour and count to reveal the hidden phrase!

“Solve this mystery, and you will take the first step toward unlocking the secret URL!”

Monkey Mode Activated!

1. Ooo ooo! Find rows where weather is ‘mist’!

2. Pick the row with the BIGGEST windspeed!
3. Grab hour and count columns and divide count by 3!
4. Add 65 to each number! 65
5. Turn those numbers into LETTERS!

Ooo OOO! Secret phrase unlocked!

```
[30]: # Find the moment when the wind was strongest during misty weather.
max_wind_speed_in_misty_weather = df[df["weather"] == "misty"]["windspeed"].
    ↪max() # (fill methods and answers in [...])
target_row = df[(df["weather"] == "misty") & (df["windspeed"] ==
    ↪max_wind_speed_in_misty_weather)]

# get the hour and count of the target row
hour, count = target_row["hour"].values[0] + 65, target_row["count"].values[0]//
    ↪3 + 65

# just change the hour and count to the corresponding ascii character
result = str(chr(hour)) + str(chr(count))

# concatenate the result to the url
url = url + result
print("your current url is: ", url)
```

your current url is: <https://kmutt.me/LU>

1.2.2 Clue 2: The Hidden Words in the Weather

The next piece of the puzzle lies in the unique weathers that were observed! To find the clue:

1. Look at all the different weather conditions recorded in the dataset.
2. Take the last two word of each unique weather type you find.
3. The combination of these words will lead you to the next step in your adventure!
4. Unravel this mystery, and you'll be one step closer to the secret URL!

Monkey Mode

1. Ooo ooo! Find all the different weather types!
2. Get the LAST TWO word of each one!
3. Combine the words to move closer to the secret!

Monkey magic will lead you to the next clue!

```
[31]: # Get the unique values of the target column
unique_values = df["weather"].unique()

# Get the last two characters of each unique value
```

```

last_two_character = [str(value)[-2:] for value in unique_values]

# Join all the last two characters
result = "".join(last_two_character)

# concatenate the result to the url
url = url + result

print("your current url is: ", url)

```

your current url is: <https://kmutt.me/LUartyin>

1.3 Clue 3: The missing Humidity

Someone tried to hide a secret message in the humidity levels! you need to see this!!

```
[32]: df["humidity"].plot()
```

```
[32]: <Axes: >
```

```
[33]: df["humidity"].mean()
```

```
[33]: np.float64(0.5590588235294117)
```

Missing value in the humidity column make their average weird.

Find the missing numbers and combine them to reveal the next part of the secret URL!

Monkey Mode

1. Ooo ooo! Find the missing numbers in the humidity column!
2. Combine the missing numbers to reveal the next part of the secret URL!

This is too easy for us. You too you also can do it!

```
[34]: # Get the number of missing values in the humidity column
missing_values = df["humidity"].isna().sum()

# Concatenate the missing values to the URL
url = url + str(missing_values)

print("your current url is: ", url)
```

your current url is: https://kmutt.me/LUartyin30

1.3.1 Clue 4: Make the Hum(idity)an back!

Yes! we got a number of missing humidity from the previous clue. Now, we need to make it back to the original data. This is too hard? [Don't worry about it](#) you can do it without my help.

```
[35]: # do it by yourself
# create function that interpolate the missing values in humidity column

# Create a function that interpolates the missing values in the humidity column
def interpolate_humidity(df):
    for i in range(1, len(df["humidity"]) - 1): # Avoid first and last index
        # Check if the value is missing
        if pd.isnull(df["humidity"].iloc[i]):
            # If the value is missing, interpolate it with the average of the
            ↪previous and next value
            df.at[i, "humidity"] = (df["humidity"].iloc[i - 1] + df["humidity"].
            ↪iloc[i + 1]) / 2

    return df

# Apply interpolation
df = interpolate_humidity(df)
```

```
[36]: df["humidity"].plot()
```

```
[36]: <Axes: >
```

now, find the average of the humidity column and add it to the missing value. Then, you will find the next part of the secret URL!

```
[37]: average_humidity = df["humidity"].mean()

average_humidity
```

```
[37]: np.float64(0.5575249999999999)
```

oh, I forgot to tell you. We only use first 3 decimal places of the average value.

```
[38]: # get first 3 decimal of the average humidity
result = str(int(average_humidity*1000))

# concatenate the result to the url
url = url + result

print("your current url is: ", url)
```

your current url is: <https://kmutt.me/LUartyin30557>

1.3.2 Clue 5: The Secret Message from the different weathers

We almost there! Find an average of each weather type in the dataset. Then use the ascii number of the sum between `clear` weather and difference of `misty` and `rain` weather to reveal the next part of the secret URL!

Monkey Mode

1. Find the average of each weather type!
2. Use the ASCII number of the sum between `clear` weather and difference of `misty` and `rain` weather!
3. Combine the numbers to reveal the next part of the secret URL!

You're almost there! Keep going!

```
[39]: # Use groupby to get the average count of each weather
average_count = df.groupby("weather")["count"].mean()

# Get the average count of clear, misty, and rain weather
clear_avg = average_count["clear"]
misty_avg = average_count["misty"]
rain_avg = average_count["rain"]

# Get the groupby_character followed by instructions (concatenating first
↳ characters of each weather type)
groupby_character = chr(int(clear_avg+(misty_avg-rain_avg)))

# concatenate the groupby_character to the url
url = url + groupby_character

print("your current url is: ", url)
```

your current url is: <https://kmutt.me/LUartyin30557L>

```
[40]: print("your final url is: ", url)
```

your final url is: <https://kmutt.me/LUartyin30557L>

1.3.3 Clue 6: Fusion!

You've made it this far! Now, You just need to combine the dataframe and and get the standard deviation of `Number of employees` column. then put it in decode tools to reveal the final part of the secret URL!

Monkey Mode

1. Combine the dataframe and get the standard deviation of `Number of employees` column!
2. Use the standard deviation as a phrase to unlock the final part of the secret URL!
3. Put the phrase in the `decode` tools to reveal the final part of the secret URL!

Don't be afraid. We will stay with you!

```
[41]: organizations_1 = pd.read_csv('organizations-1.csv')
organizations_2 = pd.read_csv('organizations-2.csv')
organizations_3 = pd.read_csv('organizations-3.csv')
```

```
[42]: organizations_1.head()
```

```
[42]:
```

	Index	Organization Id	Name \
0	1	FAB0d41d5b5d22c	Ferrell LLC
1	2	6A7EdDEA9FaDC52	Mckinney, Riley and Day
2	3	0bFED1ADAE4bcC1	Hester Ltd
3	4	2bFC1Be8a4ce42f	Holder-Sellers
4	5	9eE8A6a4Eb96C24	Mayer Group

		Website	Country \
0		https://price.net/	Papua New Guinea
1	http://www.hall-buchanan.info/		Finland
2	http://sullivan-reed.com/		China
3	https://becker.com/		Turkmenistan
4	http://www.brewer.com/		Mauritius

		Description	Founded \

2	Public Safety	5287
3	Automotive	921
4	Transportation	7870

```
[43]: def decode(value: float):
value = str(int(value))

return chr(int(value[:2]) + int(value[2:]))
```

```
[44]: # Concatenate all organization datasets together
df_organizations = pd.concat([organizations_1, organizations_2,
↳ organizations_3], ignore_index=True)

# Get the standard deviation of the column "employees" groupby_character =
↳ str(clear_avg)[0] + str(misty_avg)[0] + str(rain_avg)[0]
std_employees = df_organizations["Number of employees"].std()
```

```
# Show standard deviation
print(std_employees)
```

2850.8597994927136

```
[45]: url = url + decode(std_employees) # your variable that contains the standard
      ↪ deviation

print("your current url is: ", url)
```

your current url is: <https://kmutt.me/LUartyin30557LN>

1.4 Final Clue: Pokemon configuration

You just need to add a new column call **stat** that will have a condition below:

1. stat calculate from Attack + Defense + Speed + Sp. Atk + Sp. Def + HP
2. If it have type Normal, Grass, Fire or Water. Attack will increase by 10%.
3. If it have type Electric, Ice, Fighting or Poison. Defense will increase by 10%.
4. If it have type Ground, Flying, Psychic or Bug. Speed will increase by 10%.
5. If it have type Rock, Ghost, Dragon or Dark. Sp. Atk will increase by 10%.
6. If It have speed more than 100. Sp. Def will increase by 50%.
7. If it is a legendary pokemon. HP will increase by 100.

Then, group by Type 1 and find the average of **stat** column. This Clue is **important** you must do it, but I will give you the final part of the secret URL. The final part of the secret URL is **pikachu**.

```
[46]: pokemon = pd.read_csv("pokemon.csv")
      pokemon.head()
```

```
[46]:   #      Name Type 1  Type 2  Total  HP  Attack  Defense  \
0  1      Bulbasaur  Grass  Poison    318  45     49     49
1  2      Ivysaur   Grass  Poison    405  60     62     63
2  3      Venusaur  Grass  Poison    525  80     82     83
3  3  VenusaurMega  Venusaur  Grass  Poison    625  80    100    123
4  4      Charmander   Fire    NaN    309  39     52     43
```

```
      Sp. Atk  Sp. Def  Speed  Generation  Legendary
0         65       65    45           1      False
1         80       80    60           1      False
2        100      100    80           1      False
3        122      120    80           1      False
4         60       50    65           1      False
```

```
[47]: # Ensure the columns are of the correct type (float)
      pokemon["Attack"] = pokemon["Attack"].astype(float)
      pokemon["Defense"] = pokemon["Defense"].astype(float)
      pokemon["Speed"] = pokemon["Speed"].astype(float)
      pokemon["Sp. Atk"] = pokemon["Sp. Atk"].astype(float)
      pokemon["Sp. Def"] = pokemon["Sp. Def"].astype(float)
```

```

pokemon["HP"] = pokemon["HP"].astype(float)

# Apply the conditions based on Type 1
pokemon.loc[pokemon["Type 1"].isin(["Normal", "Grass", "Fire", "Water"]),
            ↪ "Attack"] *= 1.1
pokemon.loc[pokemon["Type 1"].isin(["Electric", "Ice", "Fighting", "Poison"]),
            ↪ "Defense"] *= 1.1
pokemon.loc[pokemon["Type 1"].isin(["Ground", "Flying", "Psychic", "Bug"]),
            ↪ "Speed"] *= 1.1
pokemon.loc[pokemon["Type 1"].isin(["Rock", "Ghost", "Dragon", "Dark"]), "Sp.
            ↪ Atk"] *= 1.1
pokemon.loc[pokemon["Speed"] > 100, "Sp. Def"] *= 1.5
pokemon.loc[pokemon["Legendary"], "HP"] += 100

# Calculate the stat after applying the conditions
pokemon["stat"] = pokemon["Attack"] + pokemon["Defense"] + pokemon["Speed"] +
            ↪ pokemon["Sp. Atk"] + pokemon["Sp. Def"] + pokemon["HP"]

# Group by Type 1 and find the average of the stat column
average_stat = pokemon.groupby("Type 1")["stat"].mean()
print(average_stat)

```

```

Type 1
Bug      391.747826
Dark     467.883871
Dragon   609.981250

Water    443.736607
Name: stat, dtype: float64

```

```

[48]: url = url + "pikachu"

print("your final url is: ", url)

```

your final url is: <https://kmutt.me/LUartyin30557LNpikachu>

1.4.1 Final Mission (Optional)

Access the secret URL and complete your quest!

Question: What is the final secret URL?

Ans: <https://kmutt.me/LUartyin30557LNpikachu> redirect to <https://www.youtube.com/watch?v=dQw4w9WgXcQ>

Enjoy the adventure!
